

E12 Embedding Development in Daily Work

Pillar	Enablement	Difficulty	Level 1
Time Required	30-40 minutes	Group Size	4-10 or 1:1
Mode	Team facilitation or manager 1:1	Format	In-person or remote
Prerequisites	L1 (Skills Diagnostic) to identify development priorities	CLOVER ERA Trigger	Lack of continuous learning opportunities, learning not embedded in daily workflow, development only happening in formal training, skill growth stagnating

Why This Works

THE NEUROSCIENCE

The 70-20-10 model reflects how the brain actually develops competence: 70% through on-the-job experience, 20% through social learning, and 10% through formal training. Most organisations invest heavily in the 10% (courses, workshops) and hope the 70% happens naturally. It doesn't. Without deliberate design, daily work teaches people to repeat what they already know rather than develop what they need.

The manager's role in enablement is to design daily work as a development experience. This means intentionally assigning tasks that stretch capability, providing real-time feedback during work (not just in reviews), and creating space for learning within the workflow rather than on top of it.

The Exercise

Phase 1: The Development Lens (10 minutes)

WHAT TO SAY

"I want us to look at our current work through a development lens. For each major task or project you're working on, ask: is this developing me or am I just repeating what I already know how to do? Both are valid. But if everything is repetition, you're stagnating."

Each person maps their current work into two columns:

- Developing me: tasks that are building new capability, stretching my skills, or exposing me to new areas
- Repeating: tasks I can do competently without growth, using existing skills on autopilot

A healthy ratio is roughly 70-80% competent execution and 20-30% development. If someone's work is 100% repetition, enablement has failed them.

Phase 2: Development Injection Points (15 minutes)

The manager and team identify specific ways to inject development into existing work without adding to the workload:

- Task rotation: swap a routine task between two team members for two weeks. Both develop new skills with minimal disruption.
- Shadow then lead: the next time a complex task comes up, have someone shadow it first, then lead it the following time.
- Stretch components: keep the core task the same but add one element that stretches (present the findings instead of just producing the report; lead the client call instead of just preparing the deck).
- Real-time coaching: the manager identifies one skill to coach during the normal flow of work over the next two weeks (not in a separate coaching session, but in the work itself).

WHAT TO SAY

"Development doesn't require a training budget or time away from work. It requires intentional design of the work itself. What can we change about how we assign, execute, or review our work that would build capability as a byproduct?"

Phase 3: Manager Development Commitment (5 minutes)

The manager commits to one development injection for each team member, connected to their L1 priority gaps:

- "For [person], I'll [specific action] over the next month."
- Review progress in 1:1s using L9 (Tracking Learning Progress).

Facilitation Notes

Situation	Response
Someone's work is genuinely 100% repetition and there's no room to change it	This is an enablement red flag. "If your role has zero development in it, we have a design problem. Let's look at whether the role can be redesigned, or whether a rotation, secondment, or project assignment could provide the development your current tasks can't."
The team says they're too busy for development	"Development isn't added work. It's doing the same work differently. Presenting the report instead of emailing it takes the same time but develops a different skill. The question isn't whether you have time for development. It's whether your current work is designed to include it."

Cross-Pillar Connections

Worksheet	Connection	Direction
L1: Skills Diagnostic	L1 identifies what to develop. E12 designs how to develop it within daily work.	L1 feeds into E12
L7: Real-World Application	L7 bridges formal learning to work. E12 designs work as the learning itself.	Complementary
OP14: Stretch Assignments	E12 operates at the daily task level. OP14 operates at the project assignment level. Both develop capability.	Complementary
L9: Tracking Progress	E12's development injections should be tracked through L9's personal learning dashboards.	Use L9 to track E12 impact
